

# Photosynthetically Active Radiation From CERES SARB

Wenying Su

Tom Charlock

Fred Rose

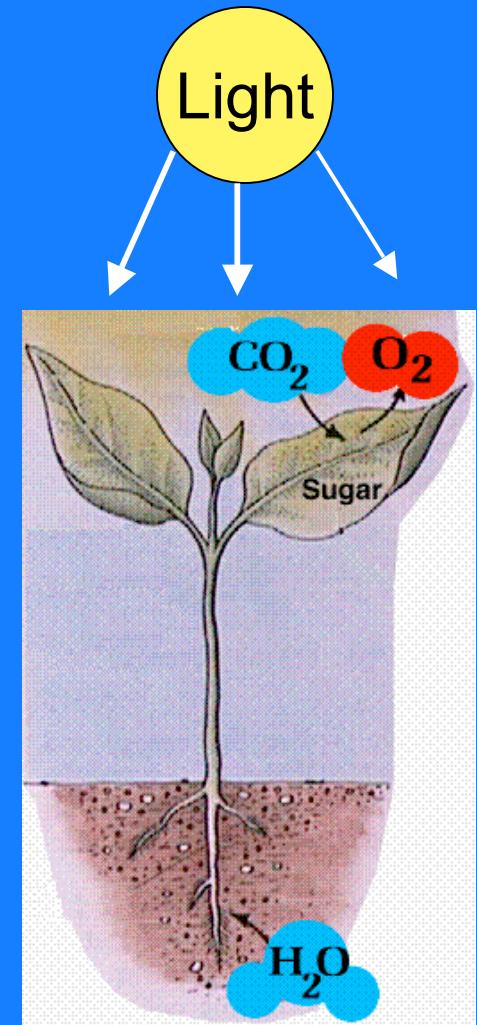

David Rutan

05/04/2006

5th CERES-II STM

# What is PAR?

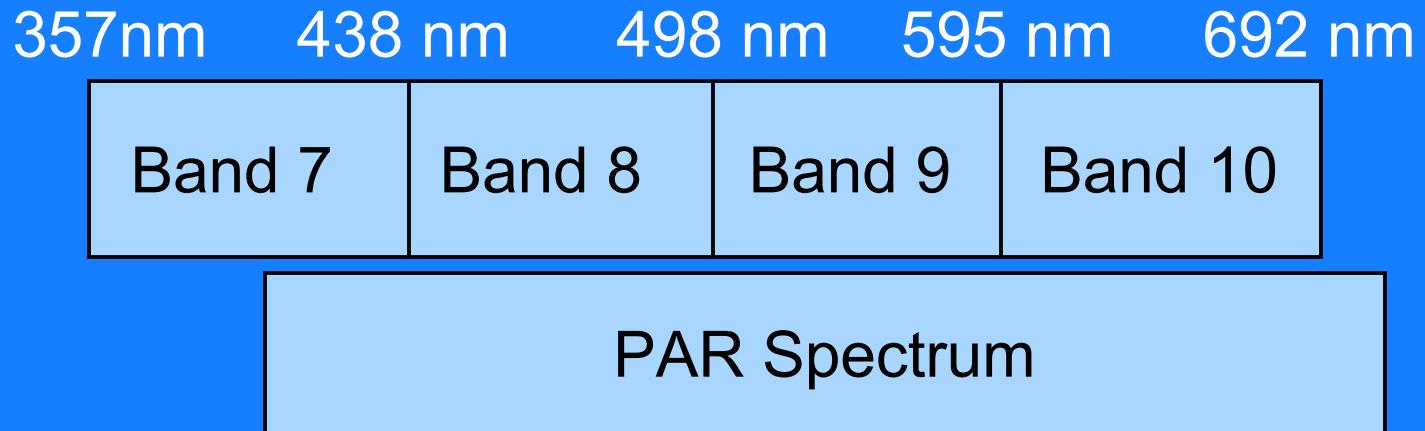

- PAR is defined as the flux from the sun in the spectral range of 400-700 nm.
- It indicates the total energy available to plants for photosynthesis, and is thus a key parameter for biological and ecological studies.
- Needed for global Net Primary Production and Gross Primary Production modeling.

# Retrieved PAR Products

- TOMS PAR (Eck and Dye, 1991);
- ISCCP PAR :
  - Potter et al. (1993)
  - Pinker and Laszlo (1992)
- SeaWiFS PAR (Frouin et al. 2003);
- CERES SARB PAR:
  - CRS Edition 2B
  - CRS Edition 3

# PAR from CERES SARB

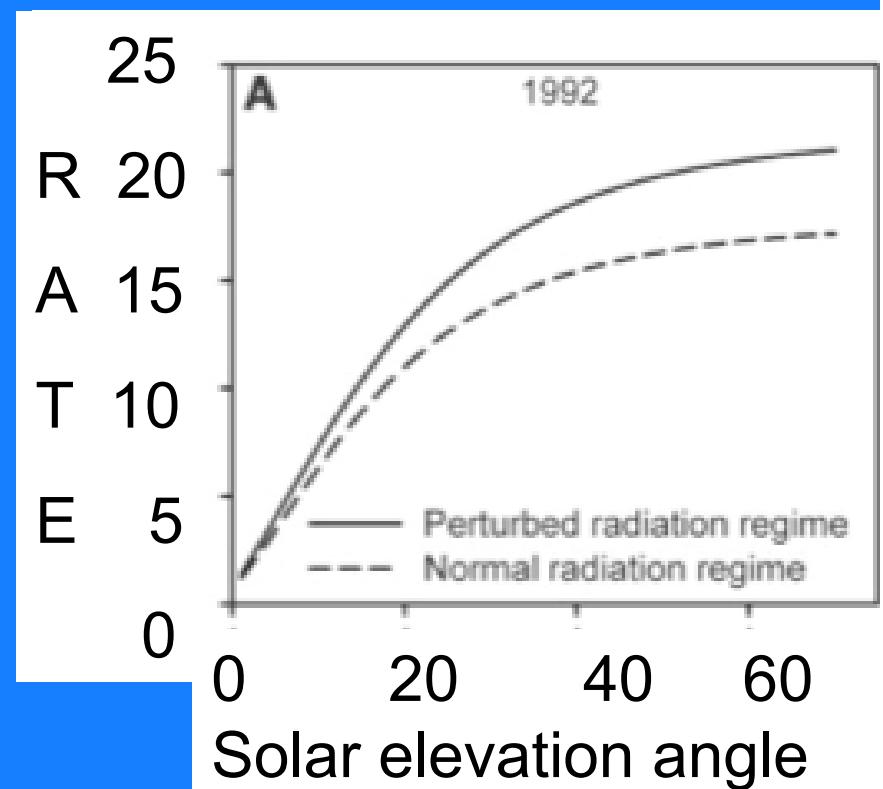

- To produce correct PAR, adjust band 7 and band 10
- $\gamma_7 = \text{Band 7}/\text{Band}(400\text{~}438)$
- $\gamma_{10} = \text{Band 10}/\text{Band}(595\text{~}700)$
- $\text{PAR} = \text{Band 7}/\gamma_7 + \text{Band 8} + \text{Band 9} + \text{Band 10}/\gamma_{10}$

# Construct $\gamma_7$ and $\gamma_{10}$ Look Up Table

- We construct look up table for  $\gamma_7$  and  $\gamma_{10}$  taking into account all the parameters that they are sensitive to
  - Solar zenith angle
  - Aerosol optical depth
  - Cloud optical depth
  - Surface albedo
- The look up table is applied to Edition 3 and SYNI SARB

# Ratio of direct to diffuse PAR

- Ecosystem can use diffuse light more efficiently
- Total PAR is important, so is the portion of diffuse PAR
- The rate of photosynthesis is increased by 23% and 8% following the 1991 Pinatubo (from Gu et al., 2003)
- CERES SARB provide

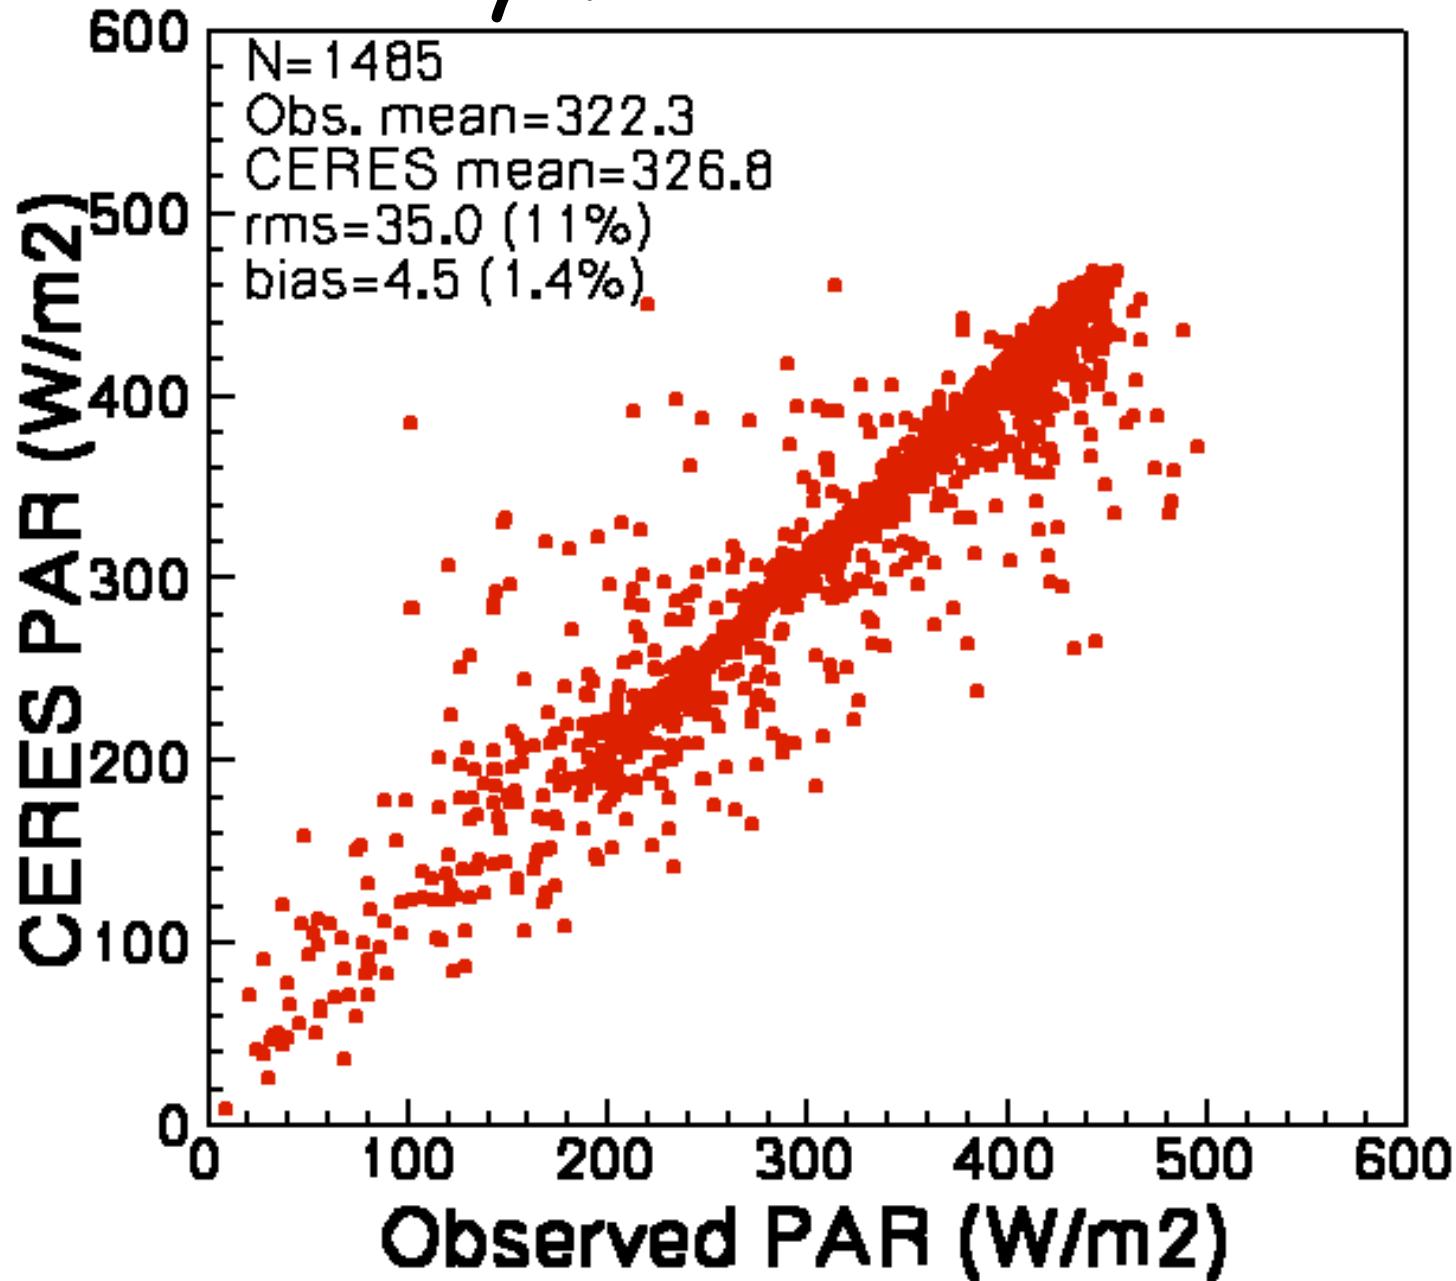

# Ground measured PAR

- Prior to the mid 90s
  - Nearly none: TOMS use pyranometer for validation
- Now
  - SURFRAD sites: 7
  - USDA UV networks: 35
  - FLUXNET sites: over 300

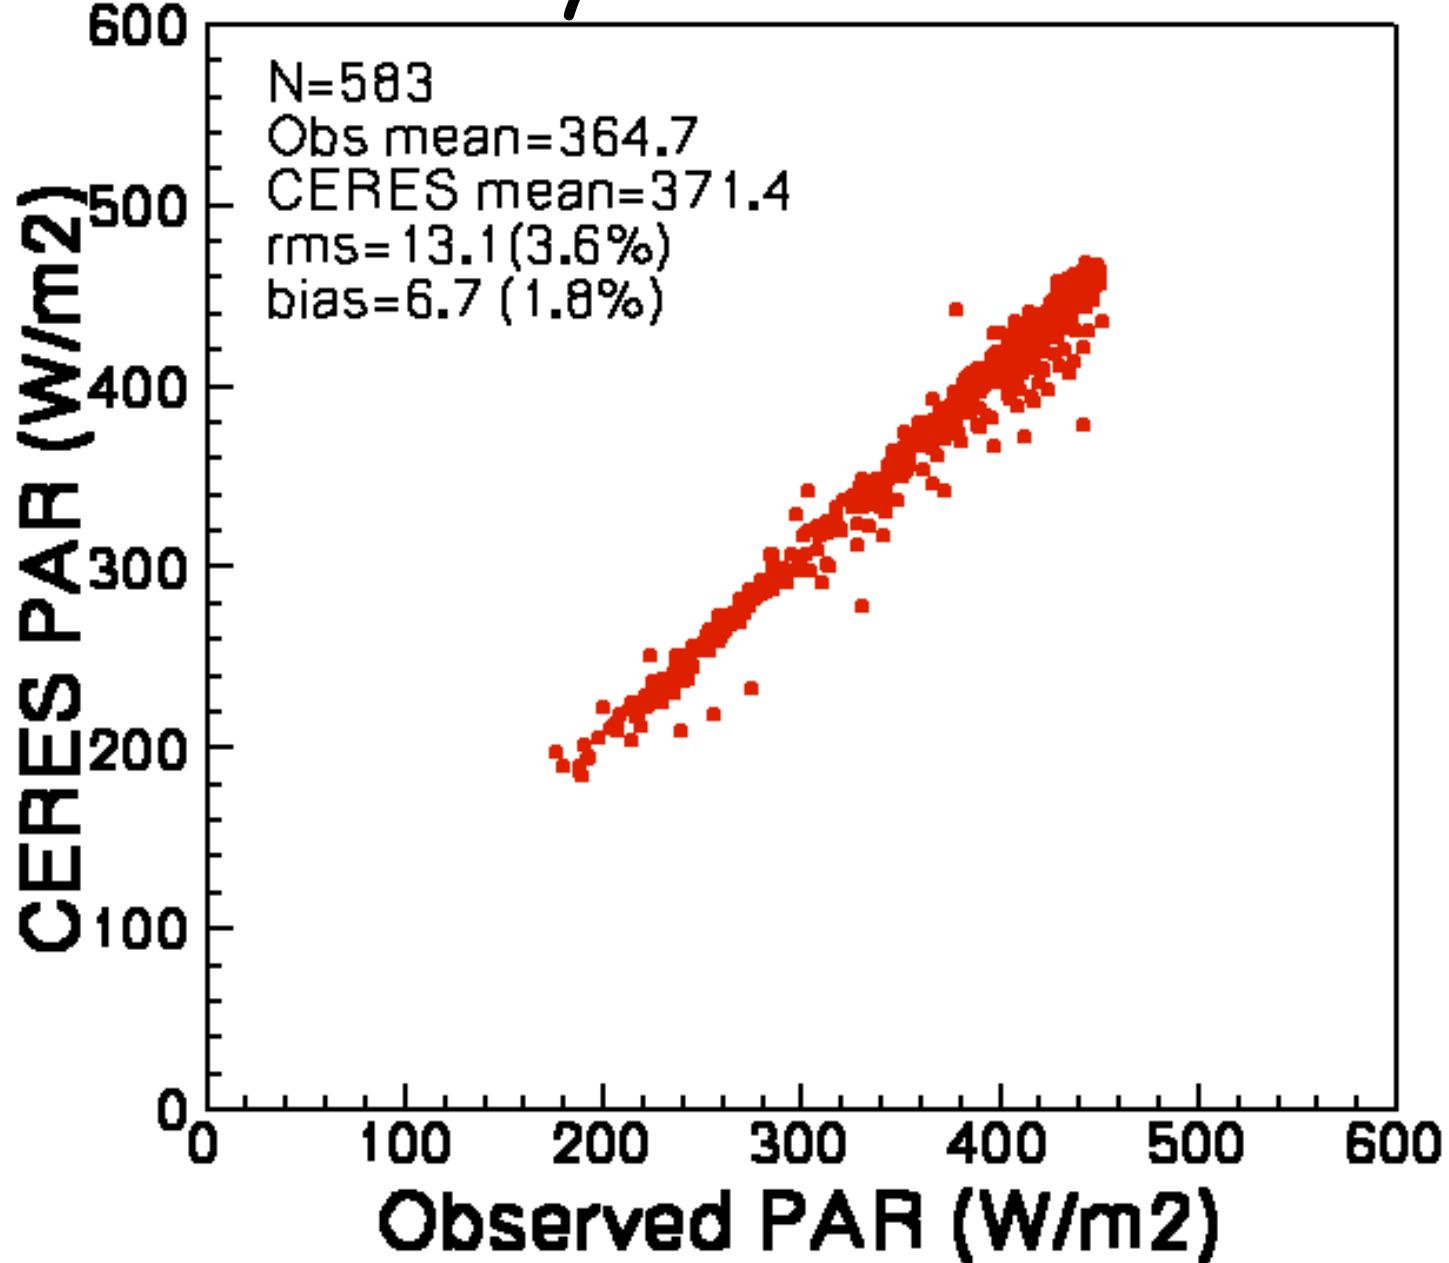

# Validation for CERES PAR

- Grand Time Series runs Ed3 like algorithm which includes the look up table we discussed earlier
- Five years data of Terra over SURFRAD sites were used for validation

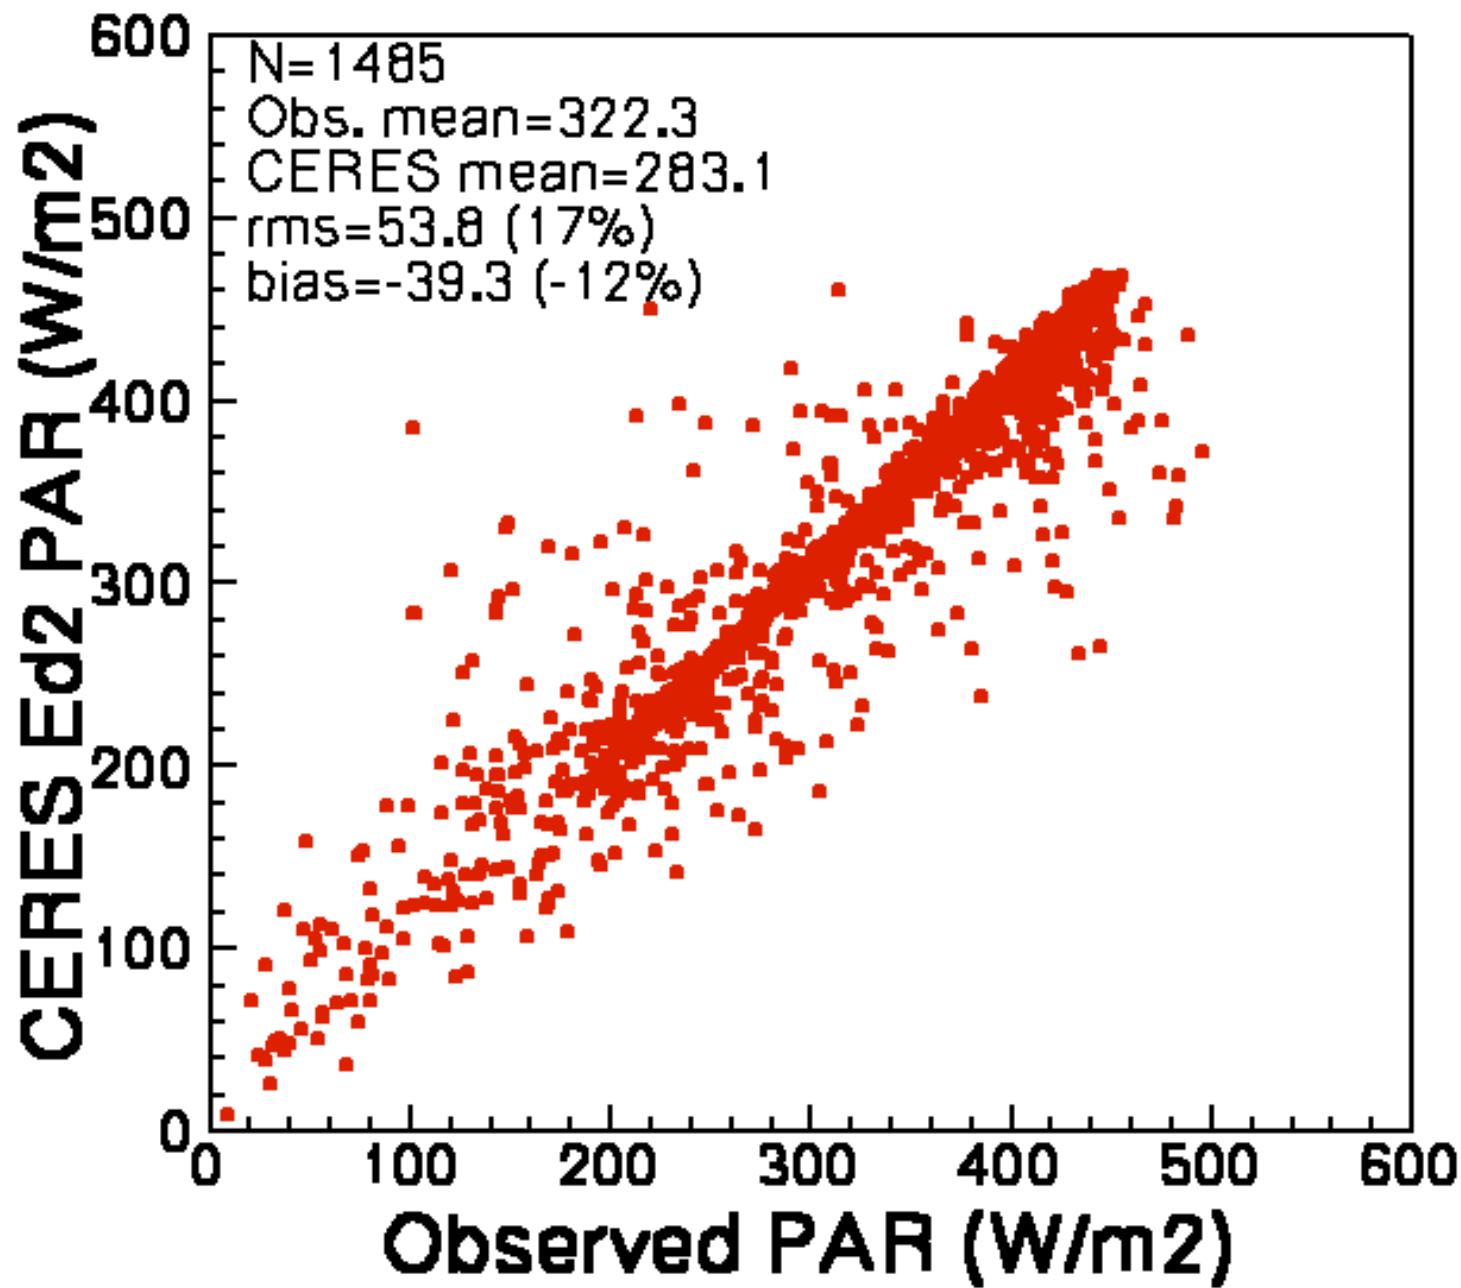

# All sky for Desert Rock

# Clear sky for Desert Rock

# Ed2 PAR: Desert Rock

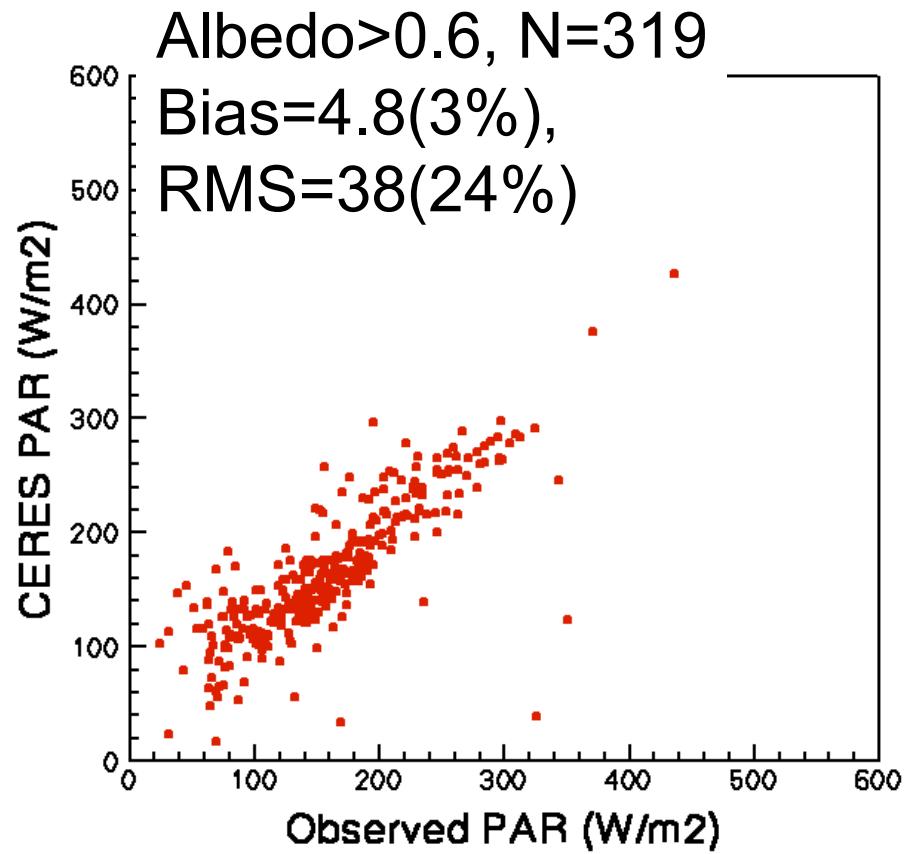

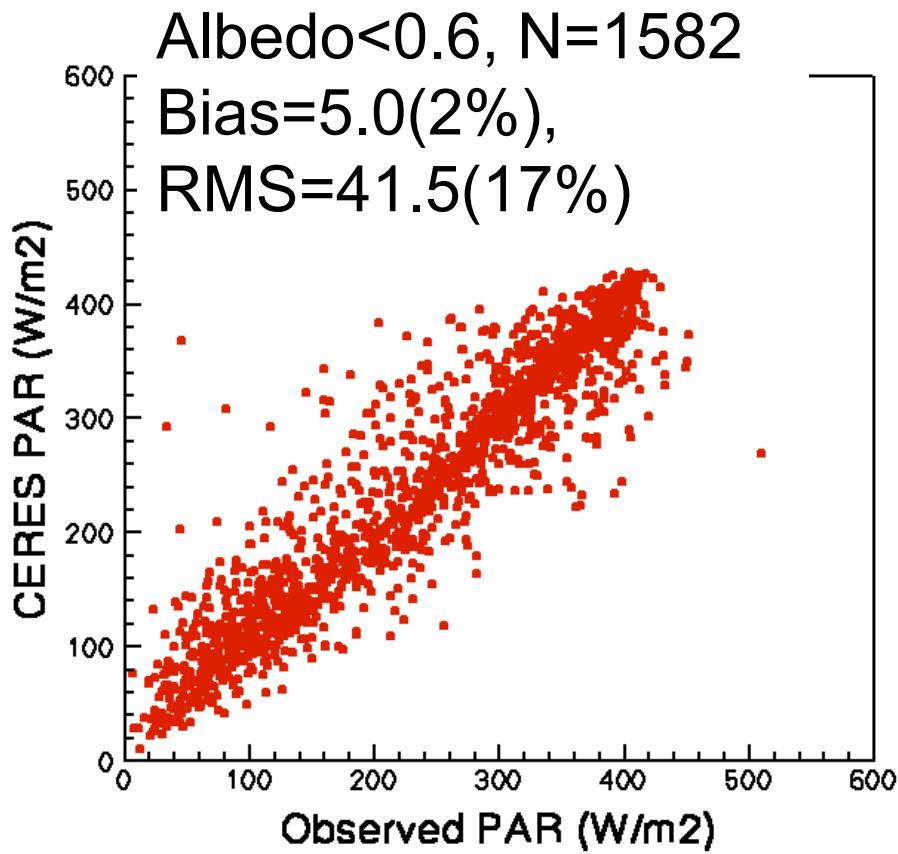

# Some statistics

- For all sky, the largest relative bias is 9.3% at Bondville, and the smallest is 1.4% at Desert Rock
- For clear sky, the largest relative bias is 6.7% at Bondville, and the smallest is 0.1% at Fort Peck

# Low vs. high albedo surface

- Fort Peck

# Low vs. high albedo surface

- Bondville

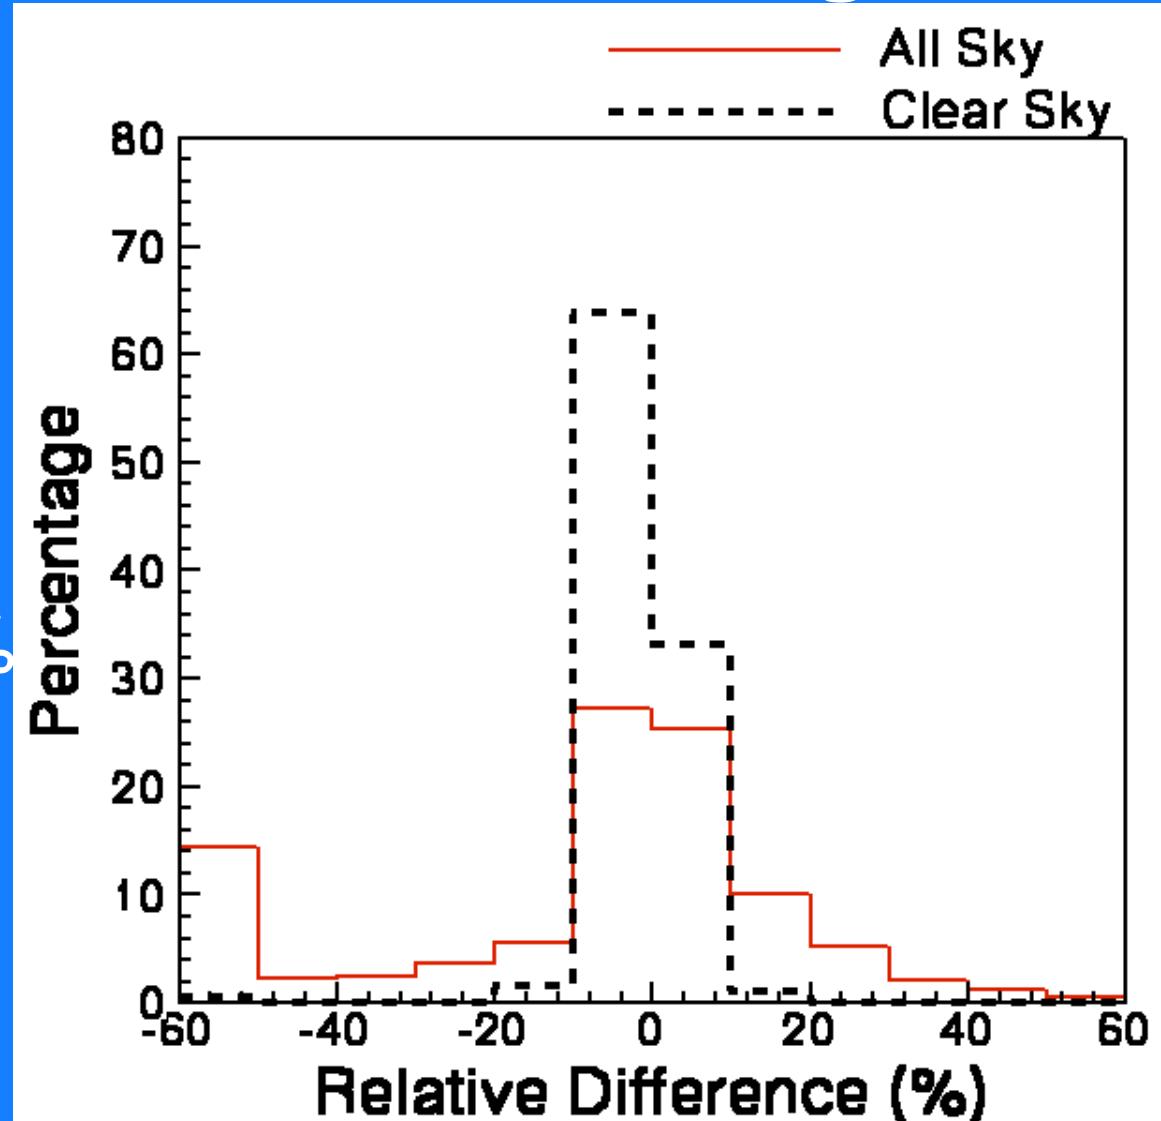

# Accuracy of the measured PAR

- According to J. Augustine the uncertainty of Licor sensor is  $\pm 10\%$ ;
- What is the percentage of our samples fall within this uncertainty?

# Relative difference histogram

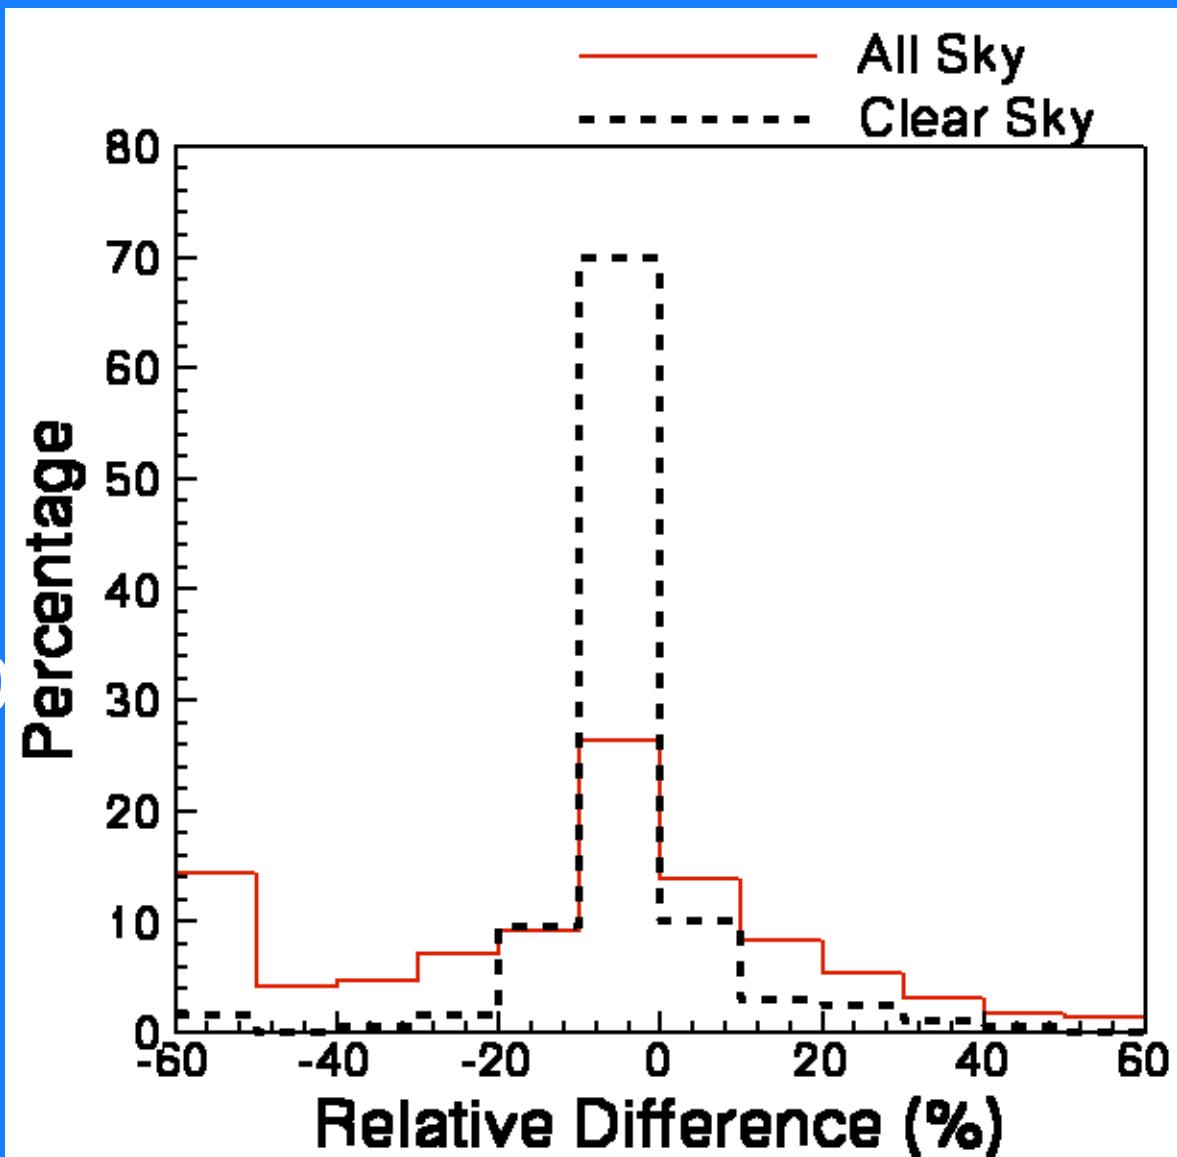

- Boulder

- All sky: 53% of sample with  $R_i$  within  $\pm 10\%$
- Clear sky: 97% of sample with  $R_i$  within  $\pm 10\%$

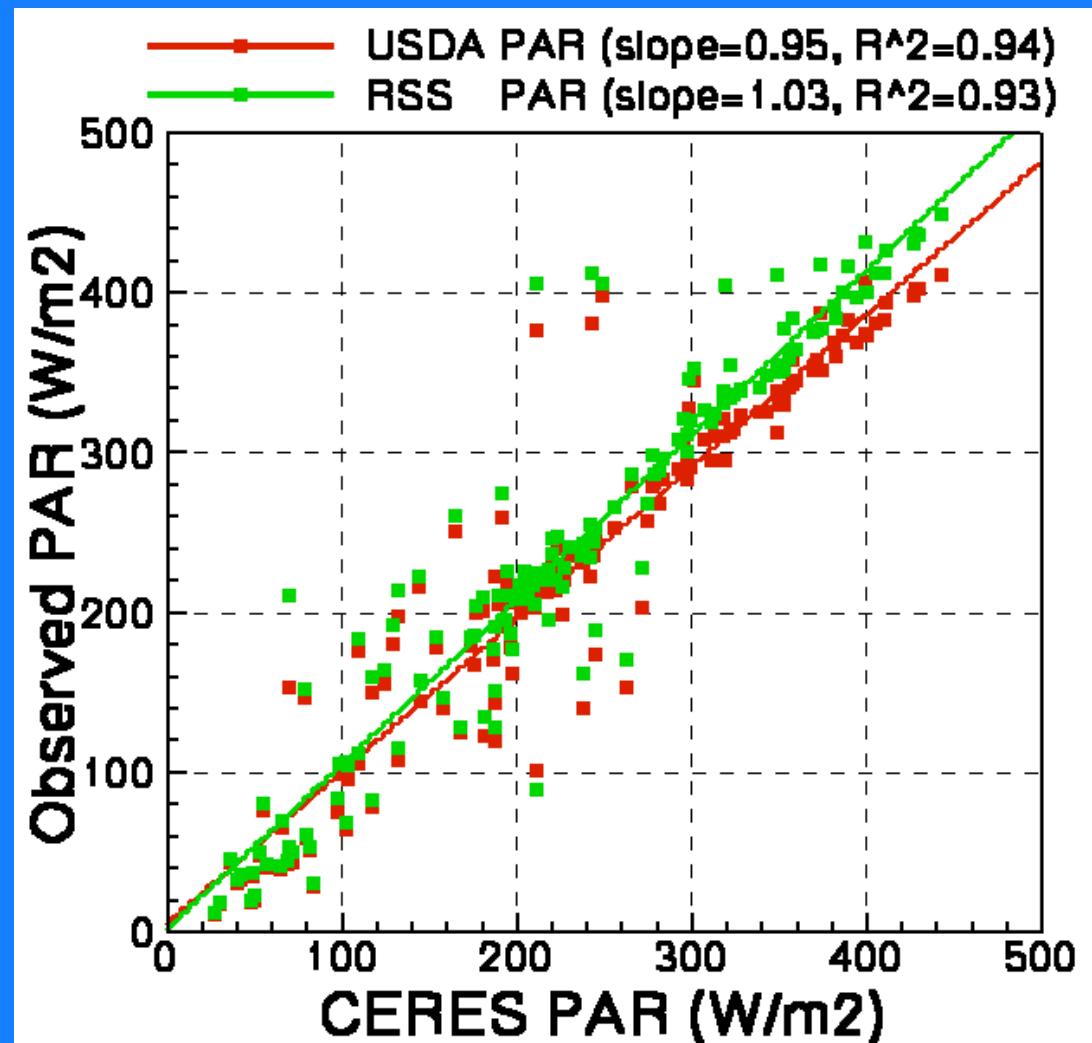

# Relative difference histogram

- Penn State
  - All sky: 40% of sample with  $R_i$  within  $\pm 10\%$
  - Clear sky: 80% of sample with  $R_i$  within  $\pm 10\%$

# CERES, RSS, and Licor PAR

- Data from Oct. 2003 to June 2004 (N=145)
- Licor vs CERES
  - Mean Licor: 227
  - Mean CERES: 232
  - RMS: 38 (16%)
- RSS vs CERES
  - Mean RSS: 242
  - Mean CERES: 232
  - RMS: 41 (18%)

05/04/2006

5th CERES-II STM

# Paradox

- CERES PAR > Licor PAR
- CERES PAR < RSS integrated PAR
- 8th BSRN report presented some PAR sensor comparison: Licor sensor, in general, measured up to 15% more than other sensors (K&Z PAR Lite, Apogee)

# Conclusions

- Look up tables were developed to produce accurate PAR from CERES SARB;
- PAR is validated using SURFRAD measured PAR. Relative bias ranges from 1.4% to 9.3% for all sky, and from -0.1% to 6.7% for clear sky;
- For high albedo surface, the algorithm underestimates the surface PAR at three out of four sites. But the absolute relative bias are comparable for both low and high albedo surface;

# Conclusions (Con't)

- For more than 10,000 validation data points, 54% are within the PAR measurement uncertainty;
- For more than 2,200 clear sky validation data points, 89% are within the PAR measurement uncertainty;
- At SGP, CERES PAR agrees slightly better with Licor PAR than the RSS integrated PAR;  
05/04/2006
- Accurate PAR sensor is needed!

# Thanks!

05/04/2006

5th CERES-II STM

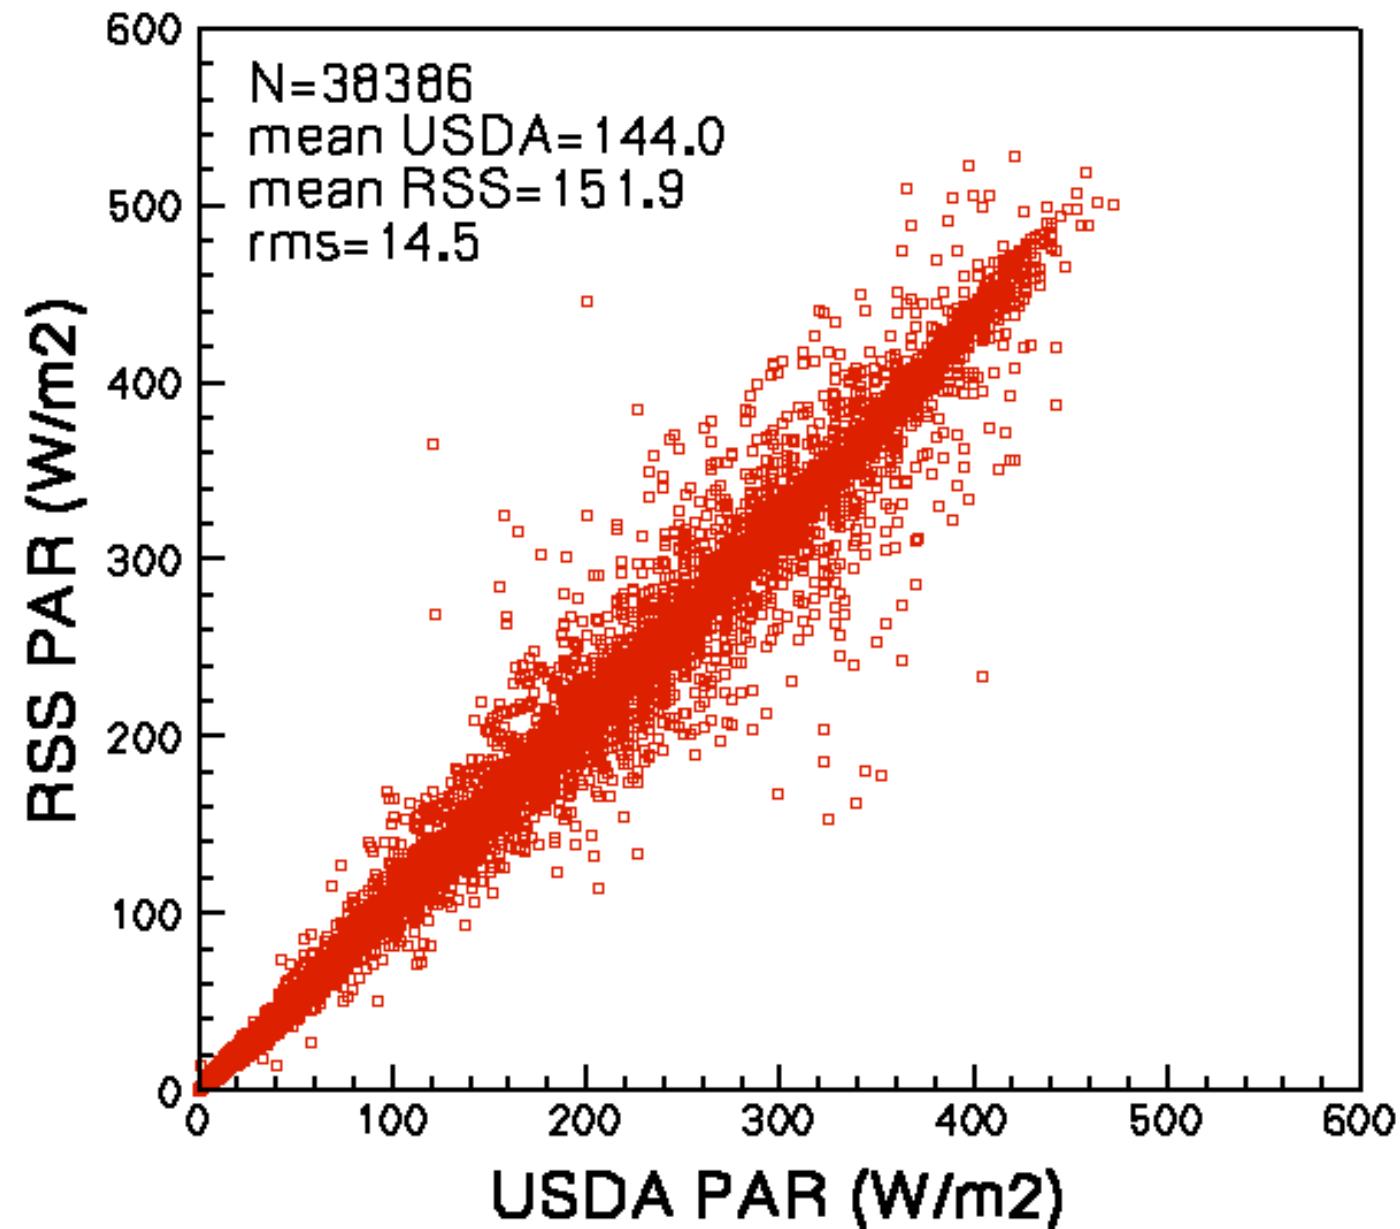

# Accuracy of the measured PAR

- According to J. Augustine the uncertainty of Licor sensor is  $\pm 10\%$ ;
- Define percentage of samples with relative difference between  $a\%$  and  $b\%$  as ( $R_i$  is the relative difference of the  $i^{\text{th}}$  sample):

$$P_{a\% \sim b\%} = \frac{1}{N} \sum_{i=1}^N \delta_i \times 100\%$$

$$\begin{cases} \delta_i = 1 & a\% < R_i \leq b\% \\ \delta_i = 0 & \text{otherwise} \end{cases}$$

# RSS vs Licor at SGP

# RSS ratio vs CERES ratio

- N=271
- Mean RSS ratio: 2.59
- Mean CERES ratio: 1.93
- RMS: 1.40
